## 1 ABSTRACT

2

reliable high frequency VCSEL includes 3 distributed Bragg reflector (DBR), an active region, and an 4 5 upper DBR. A cylindrical volume is etched from the upper DBR 6 to define a mesa with a lower surface of the cylindrical 7 volume forming an angle greater than ninety degrees with the 8 side wall of the mesa. An isolation trench is etched in the lower surface of the cylindrical volume concentric with the mesa and extending through the active region. A portion of 10 the side wall of the mesa and the lower surface of the 11 12 cylindrical volume are proton implanted. The upper DBR is 13 planarized using low-k dielectric materials and n and p electrical contacts are coupled to opposite sides of the 14 15 active region for supplying operating current thereto.
